

Code challenge App

I make this system as a Spring boot RestApp

So it will return all search data by JSON format.

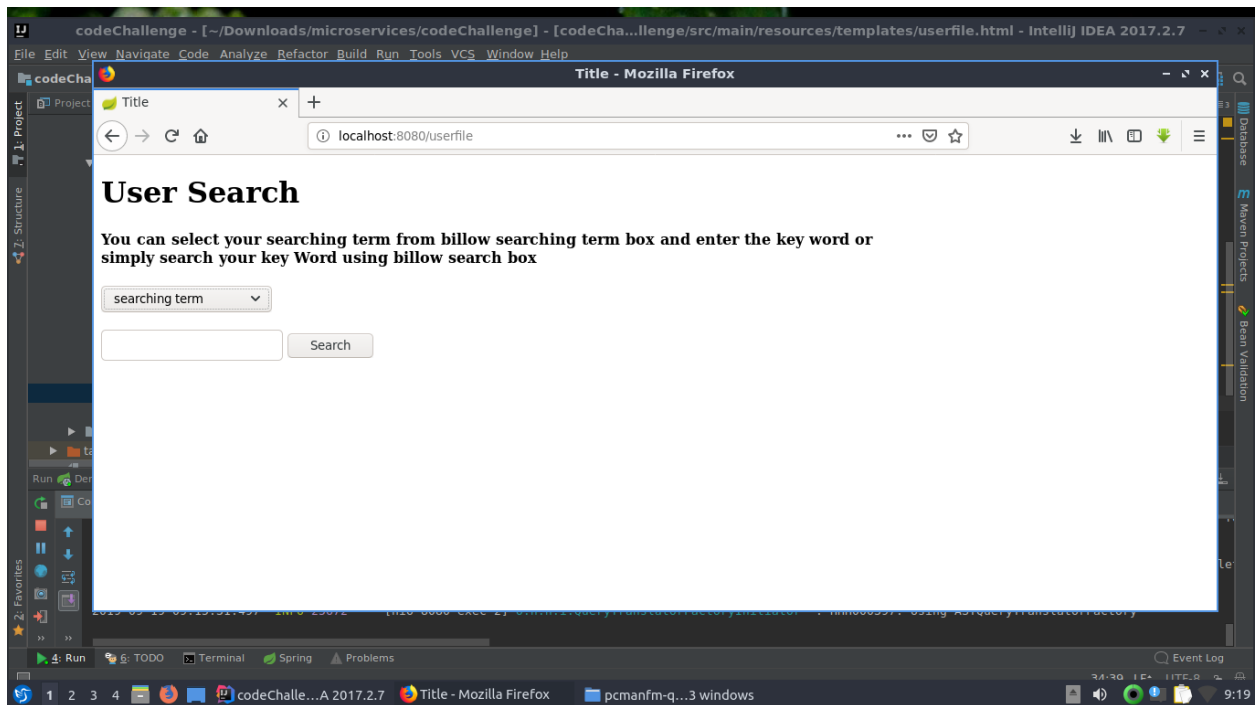

Steps-

- 1 First unzip the project and open the project folder from any Java IDE(intelij,STS,eclips)
- 2 And make sure maven update(Update project for download all library's(automatically it will download))
- 3 run the project
- 4 open the external browser and type in url- <http://localhost:8080/>

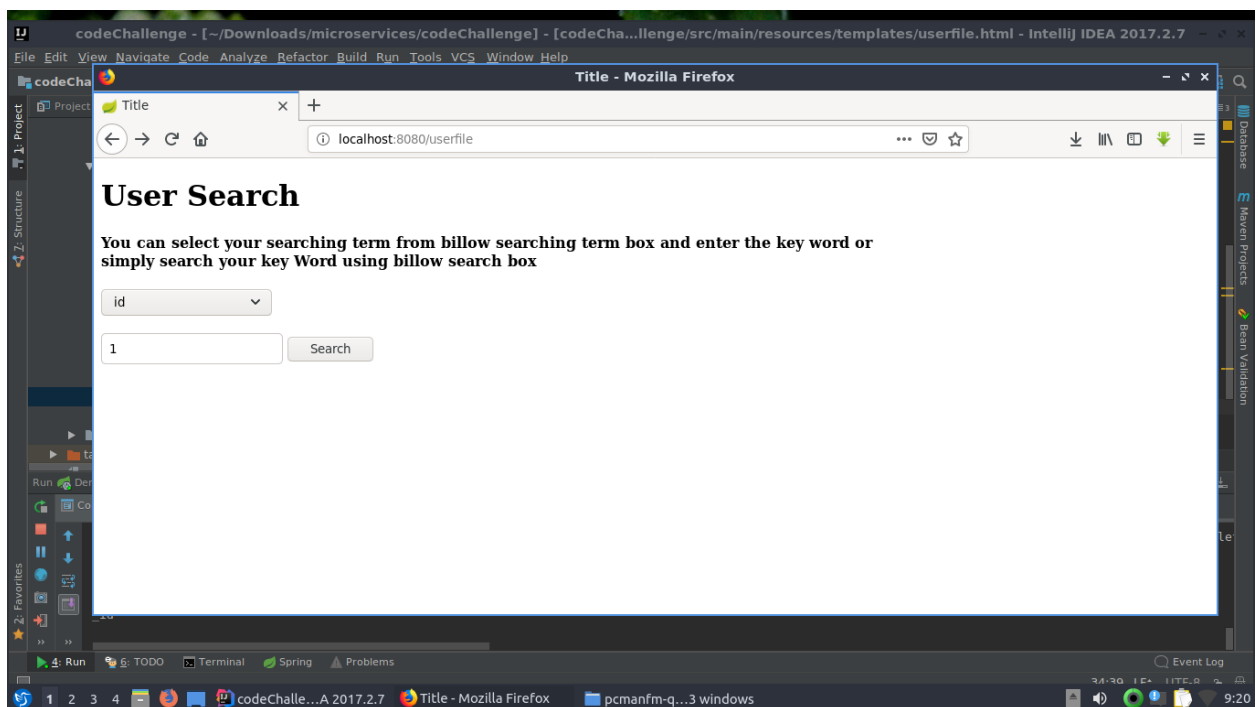

Now u get home page

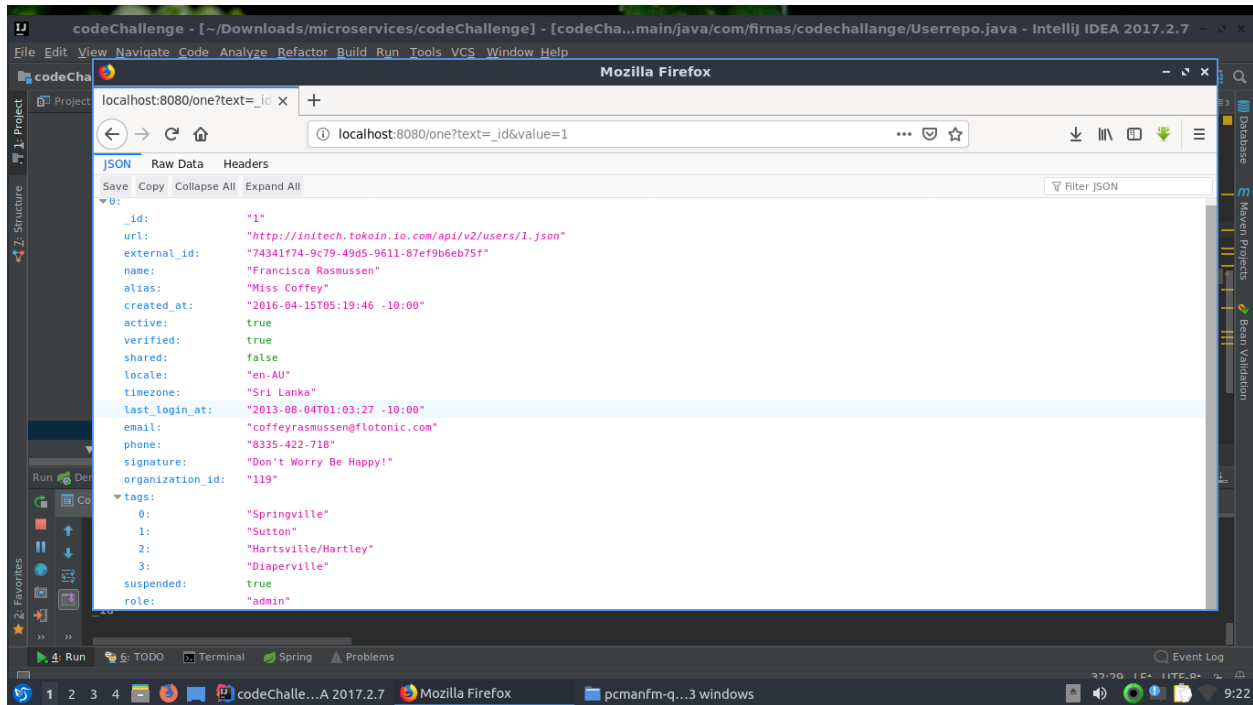

Search option

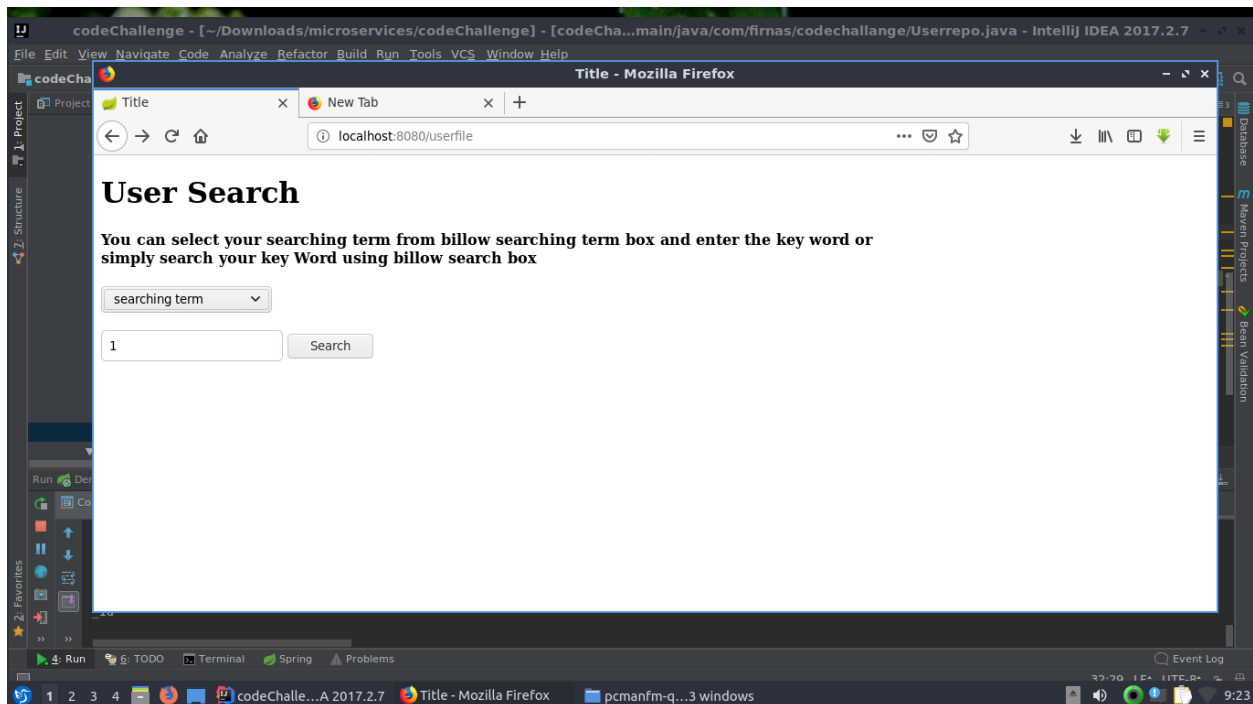

Search by id and enter value

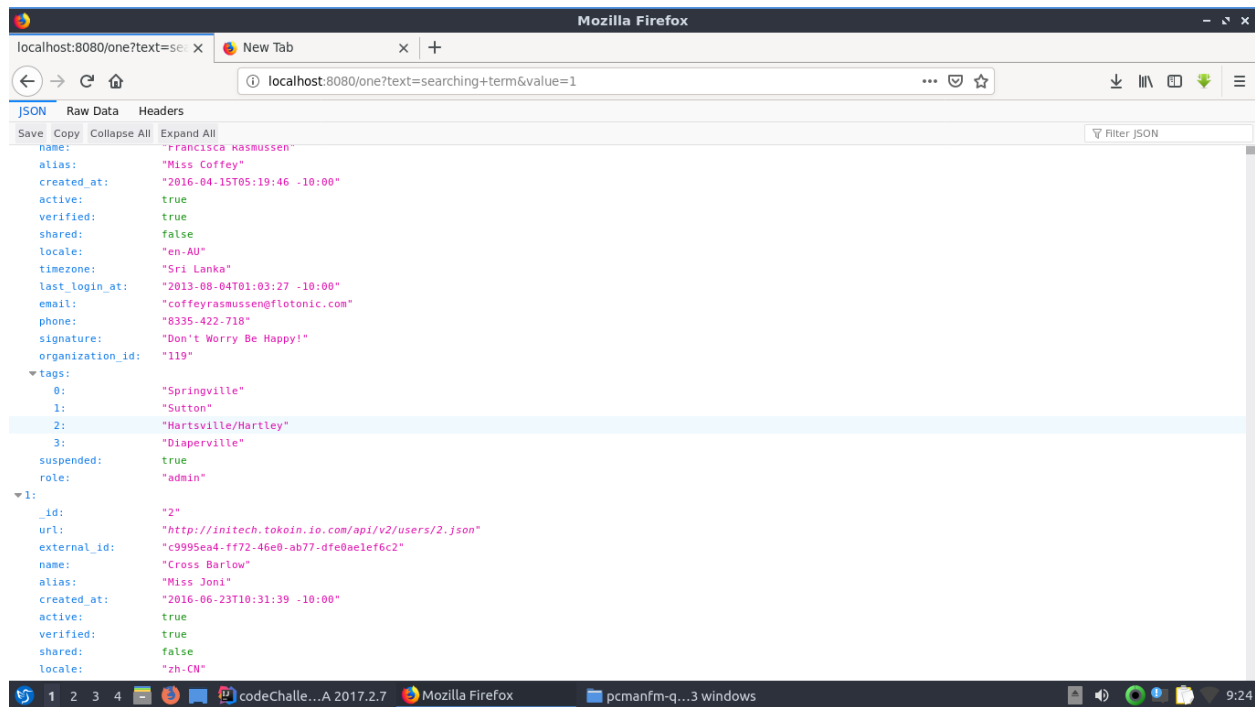

Results

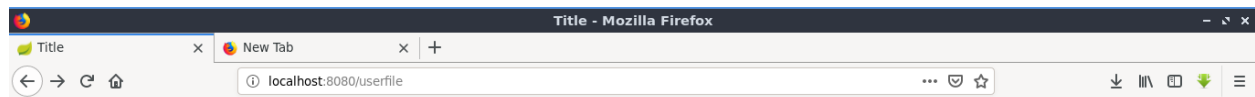

Enter value without using search option

Results

Enter invalid value

User Search

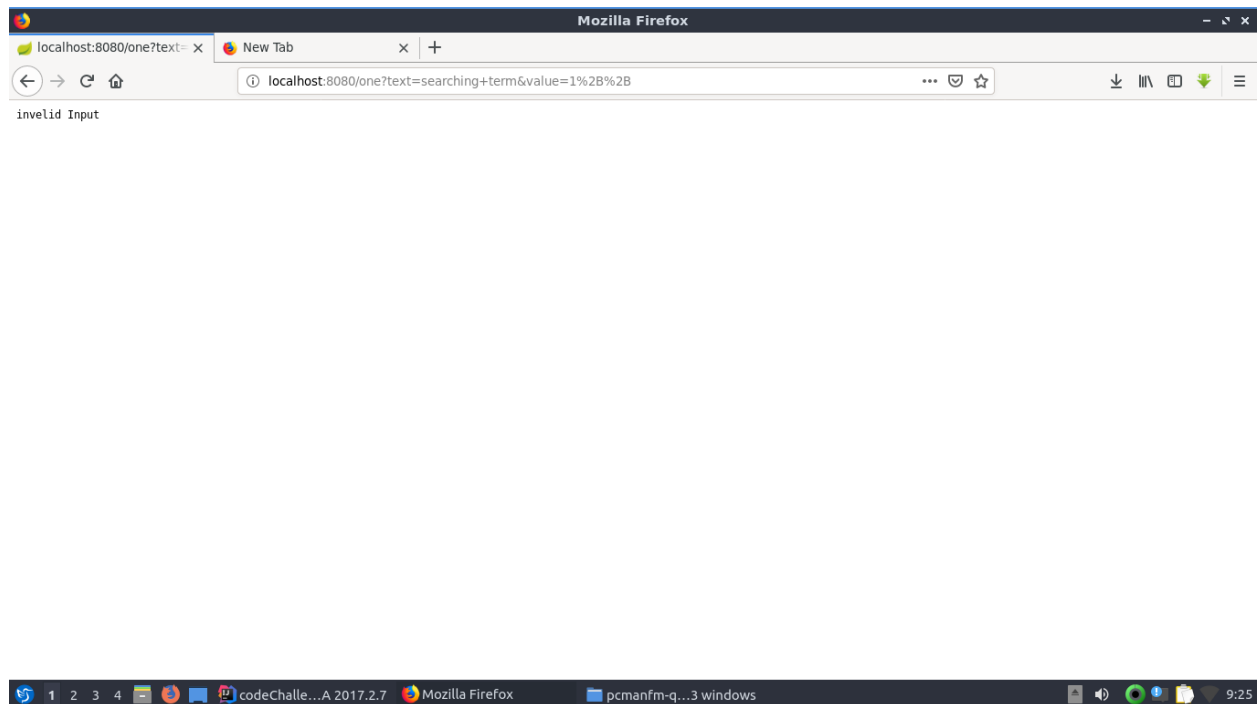

You can select your searching term from billow searching term box and enter the key word or simply search your key Word using billow search box

searching term ▾

1++ Search
